

Find customers who have purchased products from Brand "StrikerX"

Here's the correct query:

```
sql Copy Edit  
  
SELECT c.first_name, c.last_name  
FROM Customer c  
JOIN Product p ON c.Customer_ID = p.Product_ID  
WHERE p.Brand_ID = 1;
```

The join between Customer and Product is invalid, customers don't directly relate to products in the schema. We need to join Customer with orders, then with Order Item, and then with Product. Pls fix this query

Thank you for the explanation! You're absolutely right—the join between Customer and Product is invalid because customers don't directly relate to products in the schema. Instead, we need to join Customer with Orders, then with OrderItem, and finally with Product to correctly identify customers who have purchased products from the brand 'StrikerX'.

Here's the corrected query:

```
sql Copy Edit  
  
SELECT DISTINCT c.Customer_ID, c.first_name, c.last_name  
FROM Customer c  
JOIN Orders o ON c.Customer_ID = o.Customer_ID  
JOIN OrderItem oi ON o.Order_ID = oi.Order_ID  
JOIN Product p ON oi.Product_ID = p.Product_ID  
JOIN Brand b ON p.Brand_ID = b.Brand_ID  
WHERE b.name = 'StrikerX';  
↓
```

List all orders delivered by delivery agents currently marked as 'Available'

Sure, here's the query for that:

sql

Copy

Edit

```
SELECT o.Order_ID, o.date, da.first_name, da.last_name
FROM orders o
JOIN DeliveryAgent da ON o.DeliveryAgent_ID = da.DeliveryAgent_ID
WHERE o.status = 'Delivered' AND da.availability_status = 'Available';
```

The schema doesn't track historical availability status at the time of delivery, so filtering by current availability isn't meaningful for past deliveries. Please fix the query.

< 4/4 >

You're right again—the current `availability_status` reflects the *present* state of the delivery agent, not their status at the time of the order delivery. Since we can't filter meaningfully on that, the condition should be removed altogether.

Here's the corrected query:

sql

Copy

Edit

```
SELECT o.Order_ID, o.date, da.first_name, da.last_name
FROM orders o
JOIN DeliveryAgent da ON o.DeliveryAgent_ID = da.DeliveryAgent_ID
WHERE o.status = 'Delivered';
```

Find customers who have reviewed more than 3 products

Sure! Here's the SQL query for that:

sql

Copy

Edit

```
SELECT c.first_name, c.last_name
FROM Customer c
JOIN Product_Review pr ON c.Customer_ID = pr.Product_ID
GROUP BY c.Customer_ID
HAVING COUNT(pr.Product_ID) > 3;
```

i feel the join condition is incorrect and you're grouping by c.Customer_ID but selecting columns like c.first_name and c.last_name which are not aggregated or part of the GROUP BY clause. Please return the correct query

Oh yes, you're absolutely right—my bad. The join condition should match `Customer_ID` with `Customer_ID`, not `Product_ID`. And the selected columns must either be aggregated or included in the `GROUP BY`.

Here's the corrected query:

sql

Copy

Edit

```
SELECT c.first_name, c.last_name
FROM Customer c
JOIN Product_Review pr ON c.Customer_ID = pr.Customer_ID
GROUP BY c.Customer_ID, c.first_name, c.last_name
HAVING COUNT(pr.Product_ID) > 3;
```

Thanks for catching that! Ready for round two when you are.
